

GUIDELINE TO ULVERSTONE LEADING LIGHTS

The chartlet to the right shows the new sector lights established as a leading line into the Leven River. The sector lights operate day and night and have a day range of 0.85nm which is well beyond the training walls. An orange dayboard has been established on the structure so mariners can more easily identify the lights during daytime operations.

Upon approaching the river entrance, mariners should remain on a course so that the white light remains visible which indicates that they are tracking on the leading line. When the observed light changes from white to green, the vessel is West of the leading line and a course alteration should be made. When the observed light changes from white to red, the vessel is East of the leading line and a course alteration should be made.
